

Reading and writing files

Package/Method Description	
File opening modes	Different modes to open files for specific operations. <div><div>Copied!</div><div>Syntax: r (reading) w (writing) a (appending) + (updating: read/write) b (binary, otherwise text)<div><div>1. 1</div><div>1. Examples: with open("data.txt", "r") as file: content = file.read() print(content) with open("output.txt", "w") as file: file.write("Hello, world!") with open("output.txt", "a") as file: file.write("Hello, world!")</div></div></div></div>
	<div><div>Copied!</div><div>Syntax:<div><div>1. 1</div><div>2. 2</div><div>3. 3</div></div><div><div>1. file.readlines() # reads all lines as a list</div><div>2. readline() # reads the next line as a string</div><div>3. file.read() # reads the entire file content as a string</div></div></div></div>
File reading methods	Different methods to read file content in various ways. <div><div>Copied!</div><div>Example:<div><div>1. 1</div><div>2. 2</div><div>3. 3</div><div>4. 4</div></div><div><div>1. with open("data.txt", "r") as file: lines = file.readlines() next_line = file.readline() content = file.read()</div></div></div></div>
	<div><div>Copied!</div><div>Syntax:<div><div>1. 1</div><div>2. 2</div></div><div><div>1. file.write(content) # writes a string to the file</div><div>2. file.writelines(lines) # writes a list of strings to the file</div></div></div></div>
File writing methods	Different write methods to write content to a file. <div><div>Copied!</div><div>Example:<div><div>1. 1</div><div>2. 2</div><div>3. 3</div></div><div><div>1. lines = ["Hello\n", "World\n"]</div><div>2. with open("output.txt", "w") as file: file.writelines(lines)</div></div></div></div>
	<div><div>Copied!</div><div>Syntax:<div><div>1. 1</div></div><div><div>1. for line in file: # Code to process each line</div></div></div></div>
Iterating over lines	Iterates through each line in the file using a `loop` . <div><div>Copied!</div><div>Example:<div><div>1. 1</div><div>2. 2</div></div><div><div>1. with open("data.txt", "r") as file: for line in file: print(line)</div></div></div></div>
	<div><div>Copied!</div><div>Syntax:<div><div>1. 1</div><div>2. 2</div></div></div></div>
Open() and close()	Opens a file, performs operations, and explicitly closes the file using the close() method. <div><div>Copied!</div><div>Example:<div><div>1. 1</div><div>2. 2</div><div>3. 3</div></div><div><div>1. file = open("data.txt", "r")</div><div>2. content = file.read()</div><div>3. file.close()</div></div></div></div>
	<div><div>Copied!</div><div>Syntax:<div><div>1. 1</div></div><div><div>1. with open(filename, mode) as file: # Code that uses the file</div></div></div></div>
with open()	Opens a file using a with block, ensuring automatic file closure after usage. <div><div>Copied!</div><div>Example:<div><div>1. 1</div><div>2. 2</div></div><div><div>1. with open("data.txt", "r") as file: content = file.read()</div></div></div></div>
	<div><div>Copied!</div></div>

Pandas

Package/Method	Description	Syntax and Code Example
.read_csv()	Reads data from a`.CSV` file and creates a DataFrame.	Syntax: dataframe_name = pd.read_csv("filename.csv") Example: df = pd.read_csv("data.csv")
.read_excel()	Reads data from an Excel file and creates a DataFrame.	Syntax: <div><div>1. 1</div><div>1. dataframe_name = pd.read_excel("filename.xlsx")</div></div> <div><div>Copied!</div></div> Example: <div><div>1. 1</div></div>

		<pre>1. df = pd.read_excel("data.xlsx")</pre>
		<div>Copied!</div> <p>Syntax:</p> <pre>1. 1</pre> <pre>1. dataframe_name.to_csv("output.csv", index=False)</pre>
		<div>Copied!</div> <p>Example:</p> <pre>1. 1</pre> <pre>1. df.to_csv("output.csv", index=False)</pre>
		<div>Copied!</div> <p>Syntax:</p> <pre>1. 1 2. 2</pre> <pre>1. dataframe_name["column_name"] # Accesses single column 2. dataframe_name[["column1", "column2"]] # Accesses multiple columns</pre>
		<div>Copied!</div> <p>Example:</p> <pre>1. 1 2. 2</pre> <pre>1. df["age"] 2. df[["name", "age"]]</pre>
		<div>Copied!</div> <p>Syntax:</p> <pre>1. 1</pre> <pre>1. dataframe_name.describe()</pre>
		<div>Copied!</div> <p>Example:</p> <pre>1. 1</pre> <pre>1. df.describe()</pre>
		<div>Copied!</div> <p>Syntax:</p> <pre>1. 1 2. 2</pre> <pre>1. dataframe_name.drop(["column1", "column2"], axis=1, inplace=True) 2. dataframe_name.drop(index=[row1, row2], axis=0, inplace=True)</pre>
		<div>Copied!</div> <p>Example:</p> <pre>1. 1 2. 2</pre> <pre>1. df.drop(["age", "salary"], axis=1, inplace=True) # Will drop columns 2. df.drop(index=[5, 10], axis=0, inplace=True) # Will drop rows</pre>
		<div>Copied!</div> <p>Syntax:</p> <pre>1. 1</pre> <pre>1. dataframe_name.dropna(axis=0, inplace=True)</pre>
		<div>Copied!</div> <p>Example:</p> <pre>1. 1</pre> <pre>1. df.dropna(axis=0, inplace=True)</pre>
		<div>Copied!</div> <p>Syntax:</p> <pre>1. 1</pre> <pre>1. dataframe_name.duplicated()</pre>
		<div>Copied!</div> <p>Example:</p> <pre>1. 1</pre> <pre>1. duplicate_rows = df[df.duplicated()]</pre>
		<div>Copied!</div> <p>Syntax:</p> <pre>1. 1</pre> <pre>1. filtered_df = dataframe_name[(Conditional_statements)]</pre>
		<div>Copied!</div> <p>Example:</p> <pre>1. 1</pre> <pre>1. filtered_df = df[(df["age"] > 30) & (df["salary"] < 50000)]</pre>
		<div>Copied!</div> <p>Syntax:</p> <pre>1. 1 2. 2</pre> <pre>1. grouped = dataframe_name.groupby(by, axis=0, level=None, as_index=True, 2. sort=True, group_keys=True, squeeze=False, observed=False, dropna=True)</pre>
		<div>Copied!</div> <p>Example:</p> <pre>1. 1</pre> <pre>1. grouped = df.groupby(["category", "region"]).agg({"sales": "sum"})</pre>
.to_csv()	Writes DataFrame to a CSV file.	
Access Columns	Accesses a specific column using [] in the DataFrame.	
describe()	Generates statistics summary of numeric columns in the DataFrame.	
drop()	Removes specified rows or columns from the DataFrame. axis=1 indicates columns. axis=0 indicates rows.	
dropna()	Removes rows with missing NaN values from the DataFrame. axis=0 indicates rows.	
duplicated()	Duplicate or repetitive values or records within a data set.	
Filter Rows	Creates a new DataFrame with rows that meet specified conditions.	
groupby()	Splits a DataFrame into groups based on specified criteria, enabling subsequent aggregation, transformation, or analysis within each group.	

<code>tail()</code>	Displays the last n rows of the DataFrame.
---------------------	--

`np.array()` Creates a one or multi-dimensional array, Syntax:

Copied!

```
2. 2
1. array_1d = np.array([list1 values]) # 1D Array
2. array_2d = np.array([list1 values], [list2 values]) # 2D Array
```

Copied!

Example:

```
1. 1
2. 2

1. array_1d = np.array([1, 2, 3]) # 1D Array
2. array_2d = np.array([[1, 2], [3, 4]]) # 2D Array
```

Copied!

Example:

```
1. 1
2. 2
3. 3
4. 4
5. 5

1. np.mean(array)
2. np.sum(array)
3. np.min(array)
4. np.max(array)
5. np.dot(array_1, array_2)
```

Copied!

- Calculates the mean of array elements
- Calculates the sum of array elements
- Finds the minimum value in the array
- Finds the maximum value in the array
- Computes dot product of two arrays
